Effect of pre-roasting upon the flotation of phosphates.
 V. M. Vukobrat, *Gorno-Oblasti*, Zhar. No. 4, 32-5
 (1967). The sample contained P₂O₅ 22.7, R₂O₃ 4.0 and
 insol. residue 30.4%. Reagents are added in 2 stages:
 alk. soln. of carboxylic acids + carboxylic soaps 0.25 kg.
 and K₂Et xanthate 0.025 kg. per ton and soln. of car-
 boxylic acids + kerosene 0.2 kg. per ton. Main flotation
 yields a 50% concentrate contg. 20.5% P₂O₅ and a tailing
 contg. 18.5% P₂O₅. Reflotation of the concentrate will
 give a 70% new concentrate, with 28% P₂O₅ and a middling
 with 21.5% P₂O₅.

<p><i>CH</i></p> <p>18</p> <p>Enriching the phosphorites of the Bogdanov district of the Aktyubinsk ore deposits. V. M. Viktorov. Obogashchenie fosforitov, Glavkhariton i Sernykh Rud. Sbornik Rabot Nauch. Inst. Udobreniyam i Inzhel'fingisidam Ya. V. Samoilova 1939, No. 160, 132-43; Khim. Referat. Zhur. 1940, No. 8, 86. — Wet enriching is recommended for the primary concn. of phosphorite ore. Two methods are possible, (1) washing the ore in a 2-mm. screen with a preliminary breaking up of the ore to 50 mm., (2) preliminary washing of the ore, with a subsequent bolting in a screen. The 2nd method produces a const. quality concentrate. The concentrate contg. P_2O_5 18.2-18.5% at $R_2O_3:P_2O_5 = 0.18-0.20$ is floated to give a product with P_2O_5 25.5% and $R_2O_3:P_2O_5 = 0.133$. Preliminary roasting of the concentrate, before flotation, improves the quality of the final product ($R_2O_3:P_2O_5 = 0.108$), increases the velocity of flotation 1.5-2.0 times and decreases the amt. of reagent used to $1/2$. The output of the fine grinding of the concentrate is also doubled. W. R. Henn</p>

Ch

The effect of roasting phosphorites on their flotation.
 V. M. Yldirim, Obogazhenskaya Fokseriya, Glukhokovskaya
 Seraphim Rud., Shornik Rabot. Nauch. Inst. Uchenykh i
 Inzhenerov, Izd. V. Samoilova 1939, No. 151, 46
 50; Khim. Referat. Zhur. 1940, No. 6, 81-4. Roasting of
 phosphorites before flotation removes the org. substance
 and water of crystn., causes partial disson. of CaCO_3 , and
 expn. of P, and increases in P_2O_5 concn. Roasting permits
 the flotation process to be carried out without settling, be-
 cause the slime in the roasted ore is floated selectively.
 After roasting, the ratio $\text{CaO}:\text{P}_2\text{O}_5$ varies from 1.56 to
 1.43. Extn. decreases the amt. of H_2SO_4 used per ton of
 P_2O_5 , and the ratio $\text{Fe}_2\text{O}_3:\text{P}_2\text{O}_5$ becomes 0.12.

Flotation of the Upper Kama phosphorite ores with a preliminary roasting. N. S. Ulyanov, V. M. Vidonov, and V. G. Konstantinov. *Obezashchene Fosforitov, Glavkhoz i Sverdlovsk. Sbornik Rabot Nauch. Inst. Uchebnyy i Nauchnyy Tsentr. Ya. V. Samoilova 1939. No. 151, 120-122. Khim. Referat. Zhur. 1940, No. 6, 85.*

Washed concentrate, ground to 18-mm. mesh, was used for the preliminary roasting under semiconc. conditions. The compn. of the concentrate was P_2O_5 22.3 21.79 and R_2O_3 8.46 9.31%. The roasting was done in Polysius furnaces having an output of 100 40 kg./hr. The losses were 7-8%. By flotation in a 12-chamber Fahrenwald machine 2 fractions were obtained, one of which (48% of the total) contained 30% P_2O_5 and 4% R_2O_3 , and the other (52% of the total) contained 21.1% P_2O_5 . The filtration rate in a disk vacuum filter was 429 kg./sq. m., as compared with 86 kg./sq. m. with the unroasted ore. The reagents used were soda 6.0-6.5, acidole 2, crude oil 0.6, kerosene 4.4 and water glass 0.2 kg./ton for the 1st purification and 0.15 kg./ton for the 2nd purification. The duration of the main flotation was 9 min., of the 1st purification 5.0-5.5 min., of the 2nd purification 8.0-8.5 min. and of the 3rd purification 10.0-10.5 min. The ratio solid:liquid in the pulp was 1:4. Cf. C. A. 34, 4074, and preceding abstr.

PHASE I BOOK EXAMINATION YUG/5509

Grubor, Ljubo, pub.

Alometa biološka bezbedna oruđa i zaštita: zbirka članaka (Atomic, Biological, and Chemical Weapons and Protection Against Them: Collection of Articles) Zagreb, FROM, 1960. 406 p. No. of copies printed not given.

Authors of articles: Pavle Barić, Academician, Milovan Ristić, Engineer, Milorad Ristić, Doctor, Miroslav Vikić, Engineer, Milovan Vikić, Doctor, Adas Miljčević, Milovan, Engineer, Srdan Rajčević, Doctor, Velimir Vukić, Doctor, Adas Miljčević, Doctor, Adas Miljčević, Doctor, Milivoje Perić, Doctor, Svetolik Ristić, Doctor, Engineer, Milivoje Barić, Engineer and Kamilir Baryla, Doctor.

PURPOSE: This collection of articles is intended for the general reader as well as for personnel in scientific research and similar organizations.

CONTENTS: The book contains 16 articles dealing with general problems of atomic, biological, and chemical warfare weapons and defense methods. The following topics are discussed: nuclear power, reactors, nuclear explosions (including their peaceful applications), nuclear weapons, radiological detection and internal contamination by radioactive isotopes, problems of germ and chemical warfare, and the use of combat poisons. The foreword was written by Major General Rada Bulat. References follow most of the articles.

Abstract: [Authors' summary] The authors report on a case of v.p.o.c.
involving the IX thoracic vertebra of a 7 1/2 year old boy. The symp-
toms were sudden and severe after a trauma. On X-ray, in addition to
the typical vertebral change, a paraspinal, spindle shaped shadow was
visible on the left which disappeared spontaneously after four months.
Since a specific origin can be excluded, the possibility of a post
traumatic hemstoma is offered as an explanation.

Title : Comparative Effectiveness of Ultraviolet Irradiations and Subcutaneous Injections of Vitamin D in Highly Productive Cows Kept in Winter Quarters.

Orig Pub : Tr. Misk. vet. akad., 1957, 19, No 1, 28-38.

Abstract : Forty cows were subjected to UV ultraviolet-irradiations by dark-red lamps from 20 December to 10 May in the Pervonayskiy Sovkhoz, Moscow Oblast'. Sixty cows were injected with an oily solution of vitamin D. Two groups of irradiated and 2 groups of not-irradiated cows (5 cows in each group) were examined more thoroughly. The 1st group was irradiated for 16 hours per day, the 2nd group

Q-2

Abs Jour : Ref Zhur - Biol., No 18, 1958, 83362

was also irradiated for 16 hours per day, and received injections of a vitamin D concentrate as well (75 thousand μ units per day). The 3rd group was injected with the vitamin D concentrate only (150 thousand μ units per day), and, finally, the 4th group was given 75 thousand μ units of vitamin D daily. The general organic wellbeing improved in irradiated cows. In the 1st and 2nd groups the number of cows with abnormal motions decreased, shedding began a month earlier, and the incidence of complications after calving decreased also. Blood serum contained more non-organic phosphorus and calcium. The number of cases with low blood acidity became larger within the 1st and 2nd groups. Albumin fractions of protein became larger in the blood serum of 1st group cows. The live weight of calves in the 1st group was larger than in the other groups.

Role of direct and explant transplants of the anterior pituitary in the uptake of ^{131}I by the thyroid gland of hypophysectomized rats. Petar N. Martinovitch and Vlado L. Vidovic (Inst. Nuclear Sci. "Boris Kidrich", Belgrade, Yugoslavia). *Bull. Inst. Nuclear Sci. "Boris Kidrich"* (Belgrade) 3, No. 48, 131-7(1953); cf. *C.A.* 47, 4982i; Martinovitch, *Nature* 165, 33(1950); Randall, et al., *C.A.* 47, 1271d. Expts. were conducted on the influence that grafted pituitaries may have on the capacity of the thyroid gland of hypophysectomized rats to conc. ^{131}I . One group (I) of animals was hypophysectomized and subsequently grafted with anterior pituitaries of infantile rats. A 2nd group (II) was first grafted and then hypophysectomized. In the 3rd group (III), the anterior pituitaries were cultivated *in vitro* between 1 and 2 months and then grafted into hypophysectomized animals. The animals received 25 $\mu\text{c.}$ of ^{131}I , but in some cases 16 and 32 $\mu\text{c.}$ were used. Only after the 2nd grafting in I did the thyroid gland give evidence of its renewed capacity to conc. ^{131}I . From II after the reactivation of the thyroid gland by pituitary transplants was established, the grafts were removed. The thyroids returned to their inactive state 2-7 days after removal, and the process of growth was discontinued. In III were reactivated the process of growth and the ability of the thyroid gland to conc. ^{131}I . The 25 $\mu\text{c.}$ of ^{131}I proved to be injurious to the follicles of the thyroid gland. Extensive data are given. C: J. O'Brien

TITLE:

The Anodic Passivation of Silver in Alkali Solutions
(Anodnaya passivatsiya serebra v rastvorakh shchelochi)

PERIODICAL:

Doklady Akademii nauk SSSR, 1959, Vol 124, Nr 4. pp 855-857
(USSR)

ABSTRACT:

The present paper investigates the passivation of silver in solutions of KOH in the concentration interval of from 0.01 n to 10 n according to the method of measuring the capacity and the ohmic components of the impedance of the electrode at constant current density or constant potential. Impedance was measured by employing the compensation method. If a low positive potential (0.3 v against the oxide-mercury electrode in the same solution) is applied, the dissolution rate of the silver decreases rapidly, and, at the same time, also the capacity of the double layer of the electrode is reduced. These considerable modifications of the intensity of the dissolving current and of the electrode capacity occur during the passage of a smaller quantity of electricity (~ 20 millicoulomb cm^2), which corresponds on the average to about 10 molecular layers of Ag_2O . The capacity decrease

Card 1/3

SOV/20-124-4-35/67

The Anodic Passivation of Silver in Alkali Solutions

is apparently connected with the semiconductor properties of the Ag_2O . Here it is assumed that the Ag_2O -layer formed covers the electrode in a relatively uniform manner. The data discussed indicate the following: At the very beginning, before a compact Ag_2O -layer is formed on the surface, a solution with primary formation of an oversaturated solution and with a following deposition at the centers of crystallization is formed. After the formation of a compact Ag_2O -layer on the surface of the silver, the $\text{Ag} \rightarrow \text{Ag}_2\text{O}$ process apparently develops on the boundary between two solid phases. During the formation of the compact Ag_2O -layer the rate at which the process $\text{Ag} \rightarrow \text{Ag}_2\text{O}$ develops decreases considerably. This is described by the authors as the first stage of passivation. However, the process develops only during a limited period at this reduced rate. In the case of constant amperage the potential increases considerably after a certain interval of time, and the second stage of passivation begins. At the same time, slowing down of the electrochemical process $\text{Ag} \rightarrow \text{Ag}_2\text{O}$ as a whole increases rapidly. At this stage this is probably the electrochemical adsorption of oxygen on the surface of

Card 2/3

SOV/2c-124-4-35/67

The Anodic Passivation of Silver in Alkali Solutions

the silver, similar as is the case in the solution and passivation of iron in a lye. These as well as other results discussed here lead to the following conclusion: The anodic passivation of silver in lye takes place in three successive stages, and in each of these stages the rate of oxidation decreases rapidly. The investigation of the mechanism of these stages of passivation is being continued. There are 2 figures and 5 references, 4 of which are Soviet.

TITLE: Mechanism of anodic oxidation of silver in alkali

PERIODICAL: Akademiya nauk SSSR. Doklady, v. 142, no. 1, 1962, 109-112

TEXT: A previous paper by the authors (DAN v. 124, no. 4, 1959, 855) showed that the anode current in anodic oxidation of silver in alkali at constant potential (0.32 v) decreased in the first minutes after switching on, remained constant for some time, and subsequently continued decreasing. The reasons for this course of the current-time curve are studied in this paper. The overvoltage curve of the $\text{Ag} \rightarrow \text{Ag}_2\text{O}$ process shows a sharp increase of the overvoltage potential at approximately $1 \cdot 10^4 \text{ a/cm}^2$, indicating that a diffusion limiting current has been reached. Both the limiting current and its independence of the KOH concentration exclude a concentration polarization as regards the OH^- ion. On the contrary, as was shown by measuring the impedance components of the electrode in alternating current at different frequencies, ω , there is a limitation of diffusion in the arising Ag_2O layer of approximately $5 \cdot 10^{-7} \text{ cm}$ thickness.

Card 1/3

S/020/62/142/001/018/021
B145/B101

Mechanism of anodic oxidation ...

The active impedance component, R_0 , of the Ag electrode increases indefinitely with $1/\sqrt{\omega}$. The resistance equivalent to the concentration polarization is approximately 100 times higher than in the concentration polarization of the diffusing ion in solution. R_0 does not depend on the KOH concentration. It may be concluded from these results that diffusion is complicated in the oxide layer. Ag ions diffuse through the Ag_2O layer, and the $Ag \rightarrow Ag_2O$ process takes place on the boundary layer between

solution and Ag_2O . This process limited by diffusion does not continue at the same rate until the Ag electrode is completely consumed but passivation occurs, as is shown by the decrease in the anode current. This may also be observed in a shift of the overvoltage curve toward lower $\log i$ values for this period. The measurement of the active component of impedance shows that there exists no concentration polarization for this period. The following is suggested to explain passivation: Accumulation of adsorbed oxygen on the oxide surface layer effects both a decrease of the adsorption rate of oxygen and of the ionization rate of Ag atoms. The resistance of the electrochemical process calculated from the inclination of the overvoltage curve ($\psi - \log i$) and the value i increases

Card 2/3

S/020/62/142/001/018/021
B145/B101

Mechanism of anodic oxidation ...

during the whole process of oxidation, and finally reaches the constant value of $20,000 \text{ ohm} \cdot \text{cm}^2$. When trying to find out the existence of concentration polarization in the solid phase by impedance measurements the method by D. I. Leykis and L. L. Knots was applied (ZhFKh, 34, 1872 (1960)). B. V. Ershler and K. I. Rozental' are mentioned. There are 3 figures and 5 references: 4 Soviet and 1 non-Soviet. The reference to the English-language publication reads as follows: H. L. Johnston, F. Guta, A. B. Garret, J. Am. Chem. Soc., 55, 2311, (1933).

Title : Diffusion Kinetics of the Turbulent Process of Stirring.

Orig Pub : Dokl. AN SSSR, 1956, 109, No 1, 135-138

Abstract : By the value of limiting current (i_d) the dependence of diffusion by convection on temperature when turbulent and laminar processes of stirring were applied at 0°, 20° and 40° was determined, by the method of taking polarization curves, for the example of a reaction $I_2 + 2e \rightarrow 2I^-$ in a solution of 0.1M $I_2 + 1M KI$. The electrodes were: when laminar process was applied - a rotating Pt-disc with a working surface equal to $18 \cdot 10^{-2} \text{ cm}^2$ and with the speed of rotation from 13 to 49.7 revolutions per second; when turbulent process was applied - a cut of Pt-wire, soldered in glass, with surface equal to $4 \cdot 10^{-5}$, rotating with the speed on circumference from 49.7 to 123

"Data on the Pathomechanism and Clinical Manifestations of Retraction Nystagmus."

Budapest, Orvosi Hetilap, Vol 107, No 33, 14 Aug 66, pages 1547-1549.

Abstract: [Authors' Hungarian summary] The diagnostic problems of retraction nystagmus are discussed on the basis of 6 cases observed. It was demonstrated by electromyography that the essence of the disturbance in ocular motion is the synchronous contraction of antagonistic eye muscles. Excitation of the oral section of the mesencephalic tegmentum plays a role in its development. All 13 references are Western.
